The lac Operon: An Inducible Operon. The lac operon is an example of an inducible operon that is also subject to activation in the absence of glucose (Figure 3). The lac operon encodes three structural genes necessary to acquire and process the disaccharide lactose from the environment, breaking it down into the simple sugars glucose and galactose. For the lac operon to be expressed, lactose

You remember that the two strands of DNA run antiparallel: one from the 5' to the 3', and the other from the 3' to the 5'. The synthesis of the new DNA strand can only happen in one direction: from the 5' to the 3' end. In other words, the new bases are always added to the 3' end of the newly synthesized DNA strand.
